

LAKESHORE NATURE RESTORATION

Nature Restoration Project in the Districts of Tamura, Okijuku and Tozaki in the Kasumigaura Region

Aims of Project

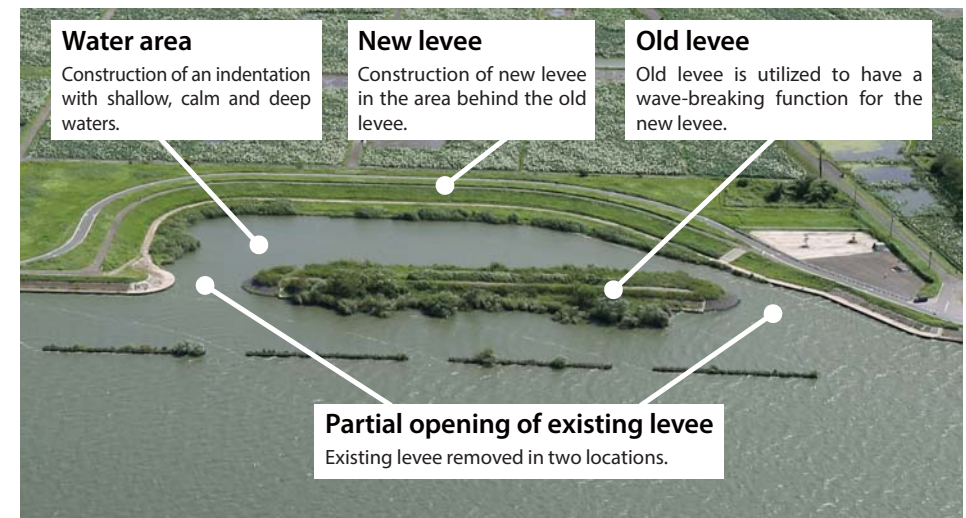

With the overall goal of “conserving and restoring the lakeshore zone that forms a point of contact between human habitation and the lake so that it can nurture and sustain a diversity of flora and fauna”, project is underway aiming to preserve and restore biodiversity and the landscape as well as to restore the connection between people and the lake.

Section B was once used as a temporary dumping yard for sediment dredged from the lake.

Work Undertaken in Section B

With the aim of restoring a habitat to support biodiversity, work is underway to make use of the former dredged segment dumping yard and improve the shape of the indentation by giving it openings that maintain continuity with the lake. Work is underway to put in place the facilities required for flood control and open up a part of the existing levee to create a range of water zones including shallow, calm, and deep waters. Instead of partially opening up the existing levee, a new levee is being constructed in the area behind it.
