

LAKESHORE NATURE RESTORATION

Nature Restoration Project in the Districts of Tamura, Okijuku and Tozaki in the Kasumigaura Region

Aims of Project

With the overall goal of “conserving and restoring the lakeshore zone that forms a point of contact between human habitation and the lake so that it can nurture and sustain a diversity of flora and fauna”, project is underway aiming to preserve and restore biodiversity and the landscape as well as to restore the connection between people and the lake.

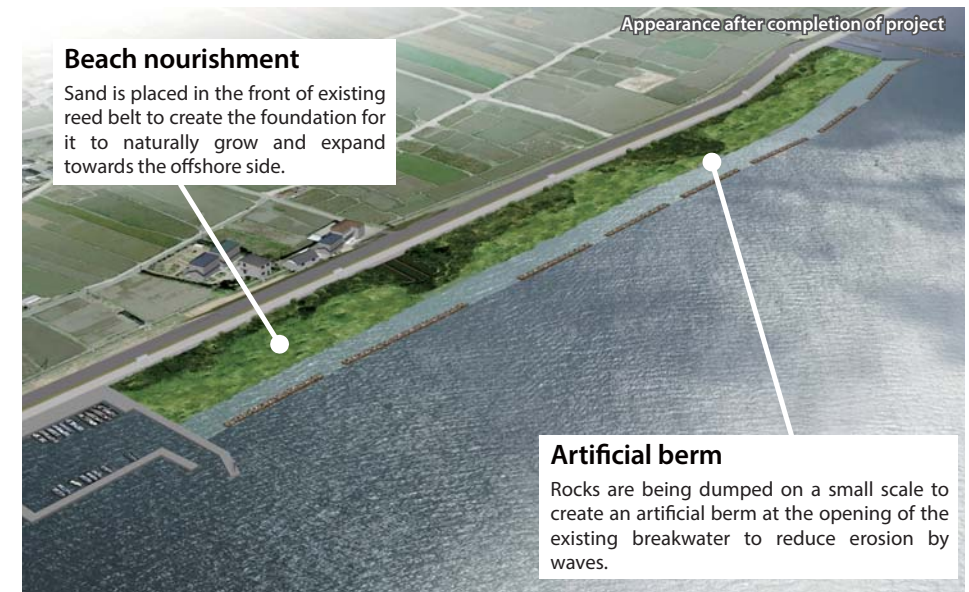

The area the project is being carried out in is divided into nine sections from A to I.

In Sections G to I, the lakeshore vegetation zone extends from the lakeshore levee out to distances between 20m and 80m offshore.

Work Undertaken in Section G

The aim is to restore the waterfront space so that it has continuity with the lake while preserving existing vegetation, with other works underway including the utilization of existing breakwaters, nourishing a beach in the front of existing vegetation and putting in place an artificial berm. We hope that existing vegetation will grow and expand naturally towards the offshore side.
